

## Quick Start

To install the Network Shutdown Module in 5 minutes, please perform the following steps on a machine running Windows 2000 / XP / 2003 / 2008 / Vista, Linux or Mac OSX:

- **Step 1 (Pre-requisites)**

Check that following [connections are operational](#):

- > the electrical connection between the UPS and the server to protect
- > the network connection between the UPS and the Network Management Card (or Proxy).

- **Step 2 (Optional)**

To enable the configuration and supervision remote access, Network Shutdown Module needs [the 4679 and 4680](#) ports (UDP/TCP) to be opened in the Firewall (Automatically opened in the Windows Firewall).

- **Step 3 (Software Installation)**

On a Windows 2000 / XP / 2003 / 2008 / Vista, Linux or Mac OSX machine, execute the "Network Shutdown Module" package under an administrator account.

- **Step 4 (Configuration)**

> In the **Configuration->Power devices** screen,

Enter the default Login «**admin**» and default Password «**admin**»  
Then click on the **Add** button and

> Enter the IP (or the host name) of the Network Management Card (or Proxy)  
or use the following new function:

*New: With the Quick Scan ... button, available with version 3.10 and later, you can discover in a few seconds the cards connected to the network and then select a card from the list.*

Power device configuration	
Name or IP address:	166.99.250.81 <input type="button" value="Quick scan..."/>
Type:	Uninterruptible Power Supply (UPS)
Powered by:	Main outlet group

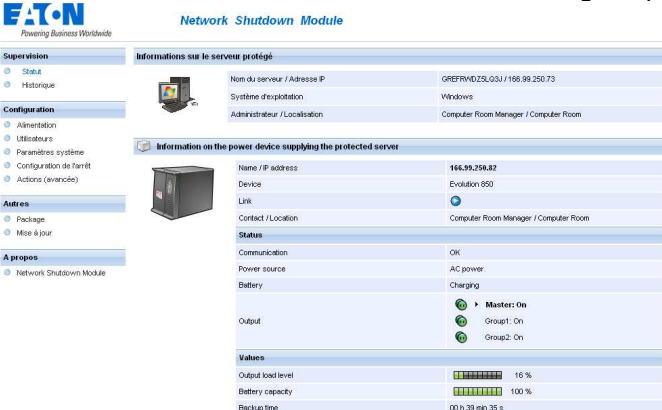

> **Save** your configuration

> In the **Configuration->Users** window configure your [password](#) (recommended)

> For the multi-UPS configurations, please refer to [chapter 6](#)

- **Step 5 (Operation)**

You can now supervise the UPS state and the information concerning the protected server
